

Retest score missing from MAP Growth reports.

Retest score missing from MAP Growth reports

🕒 Jan 4, 2022 · Knowledge

Symptom

You retested a student, but the new test score is missing from MAP Growth reports.

Explanation

Standard error of measure: Definition and calculations When a student has more than one test in a subject area, MAP Growth selects the test with the lowest standard error of measure (an indicator of test precision) as the growth test valid for reports. This is not always the most recent test, or the test with the highest RIT score. For more details, see [How does MAP choose which test to include on reports when a student retests?](#)

Solution

To change which test appears on reports:

A user with the Data Administrator role can suppress the unwanted test from reports. See [Fix Test Event Records](#) for instructions. Changes will take overnight to appear on reports.

To view the score:

Some reports show scores that are invalid for growth, allowing you to see RIT scores for all tests the student took in a term. These scores will appear in grey text. The reports that show invalid or non-growth scores are:

- [Class report](#)
- [Grade report](#)
- [Student Progress report](#)
 - Choose the report option **All Valid**.
 - Scores appear in the chart on the right, not in the graph.
- [Comprehensive Data File](#)
 - Only the Comprehensive Data File in the Data Export Scheduler options will include invalid scores. The Combined Data File will not. For more information on data exports, see [What data is in the Comprehensive Data File and Combined Data File?](#)
